Journal

I found a partner in recitation and immediately got excited about building something. Started scrolling Pinterest for table ideas and inspiration. We decided to build a table instead of a chair because it seemed more practical and useful.

Downloaded Fusion 360 so we could share the project and visualize it together.

Got each other's phone numbers to coordinate and make planning easier.

Used my MacBook to measure and plan the dimensions we wanted for the table. Compared to the Amazon inspiration piece, which was smaller than what we wanted, we decided to make our table larger.

Went to Home Depot to buy 10 pieces of wood, carefully picking the best-looking ones and skipping the really poor-quality boards. Also picked up deck screws that seemed like a good size for our project.

Emma is coming over on Sunday to help assemble and work on the table together.

Spent about 10 minutes cutting each piece of wood into the four pieces we needed. Plan to take everything to the BTU next week for cutting and assembly to make it easier and more efficient.

All the wood pieces are now cut and ready. Started by drilling pilot holes to prevent splitting, then screwed everything together. I had to leave after the recitation, but we got a good amount done. Emma continued working on assembling the last pieces.

Over the weekend, I plan to finish screwing all the pieces together and make sure everything is secure. Brought the assembled piece from ATLS back to my house to finish the last screws.

Once complete, we'll double-check that everything is even and stable before using the woodshop again.

Added another layer of support to the other two sides of the table. Cut the edges to make it even.

BOOM WE CAN STAND ON IT!
